Report

The ways that HTML, CSS, and JavaScript would be used with in the library field would be through the means of creating the facilities website for its users to browse. The HTLM will be used to formulate what information the facility wishes to present within their webpage. For example, creating paragraph tags to place the information about the facility as well as a table tag to organize their materials within the collection. With the use od CSS the library would be able to organize their webpage to make it more visually appealing for the users to look at, as well as providing links for the users to move to go to different web browsers to further their research within the facilities database. JavaScript will help make the web page more interactive for users through the means of surveys that they can perform or searching information through the databases using the webpage browser.

These three coding methods can be also used to create the libraries online database where the libraries material can be stored for users to search for, as well as creating quick online surveys for users to possibly use to get feed back about the facility. Lastly, they can be used to create a membership page for users who wish to get the lasts information on the library through their emails. These are the ways that I believe a library can use these three coding methods.
